Factors Associated with Computer Usage by College Students

The use of computer technology is growing within the college student population, yet relatively little is known about the patterns of usage and its health consequences. A questionnaire was administered to a sample of students to gather information about the pattern of use, work environment and ergonomics, daily life style, stress, and health conditions. After entering and coding data, I performed some basic descriptive analyses to seek relationships among the variables listed above. Data analysis is currently being completed, and the work will be prepared for public presentations and publication.
